Eligible

May 19, 2026

Hiring Manager, Cost Engineering Data Team
Spotify Technology S.A.
Toronto, Ontario, Canada

I'm applying for the **Senior Data Engineer — Cost Platform** role at Spotify. Building reliable infrastructure for billing, cost-center, and usage analytics is the work I've been doing for twelve years — and this is one of the clearest fits I've come across.

At Total Quality Logistics I own pipelines for revenue, billing, and cost-center reporting across multiple business units. I designed the Medallion architecture (Bronze → Silver → Gold) in Delta Lake with enforced immutability, built the dbt transformation layer on Snowflake with full contract testing and SCD Type 2 tracking, and engineered Airflow DAG orchestration to replace brittle cron jobs with observable, dependency-aware workflows. The outputs power daily self-serve reporting for Operations and executive stakeholders — they trust the numbers without needing to involve engineering. That's the outcome Spotify's Cost Platform is built to produce, and it's what I've been accountable for delivering.

At Prime Healthcare I owned the auditability framework for billing and cost-per-department data under HIPAA — same correctness and traceability standards that cost and emissions reporting demands. At Cargill I built on **GCP** (BigQuery, Dataflow, Pub/Sub) and Azure in parallel, integrating Oracle ERP, Hadoop, and SQL Server into a platform used by Procurement and Operations teams globally. I move comfortably between GCP and Azure and default to cloud-agnostic designs that don't create lock-in for the team inheriting them.

What draws me to Spotify specifically is the ownership model. I don't hand off pipelines — I own them end-to-end: reliability, observability, evolution, and the relationships with the Engineering and Business partners who depend on them. I've led org-wide migrations, set standards the whole data team adopted, and mentored engineers to build systems with genuine pride. That's how I work naturally, and it's what I understand Spotify expects from a senior engineer on this team.

I'd welcome the conversation. Happy to speak in depth about the Cost Platform's data architecture challenges and where I can contribute from day one.

Sincerely,

Vinay Gundamaneni
